

STANDARD OPERATING PROCEDURE

HOW TO MANAGE PRODUCTION ISSUE

REVISION HISTORY

Revision No./Version No.	Date	Prepared by	Approved by	Details of Change
1.0	01-July-2025	Tanvi Samant (Software Developer)	Prachi Kamat (Assistant Manager IT)	Initial Release

OBJECTIVE

This SOP outlines the standardized process to identify and resolve production issues in a controlled and efficient manner.

PARTICIPANTS

Project Manager (PM): Monitor and analyse to avoid repetitive Issues and ensure timely compliance.

Implementation Engineer(IE): raises a "Production Issue", explains the scenarios faced on production and checks the same after fixture.

Team Lead(TL):Reviews and understands the issue and reviews fixes.

Engineer: Analyze issues and implements fixes.

INTRODUCTION

1. What is a Production Issue?

A Production Issue refers to any problem or unexpected behavior that occurs in a live (production) environment of an application. Its an unexpected defect, crash, performance glitch, or misbehavior that only surfaces in the live system, despite having passed through development, QA, and staging stages

2.Following are few examples of Production issues

- System outages or downtime where users cannot access features.
- Performance bottlenecks causing slow page loads or backend delays.
- Unable to view or search .

- Error on pages.
- Functionality which is not working.
- Status of the application not posted on Goa Online portal.
- Payment status not reflected.
- The applicant is not able to upload documents during compliance.
- Pay now button not shown in applicant's login.
- Below mentioned bank is not available in system.
- Error while esigning the application.

PROCEDURE

1. PM should either raise a GELJIRA ticket towards "Production Issue" or get it raised by their implementation engineer.
2. The issue should be raised only after verifying that the error truly exists in the system.
3. While raising ticket PM/IE should ensure to attach error screenshot/ client request letter/ any supporting document and mention in detail in description the issue faced.
4. Mark the ticket to the respective TL.
5. TL/Assigned Developer to analyse the issue as follows:
 - a. It's a valid production issue: Check whether the problem is coming from the application code or from the database.
 - b. It happened due to a mistake by the applicant: Discuss the case with the TL/PM. If needed, treat it as a back-end data update request after confirmation from PM.
 - c. It's something that was never part of the system: Inform the Project Manager so it can be considered as a new change request.
6. Review and replicate issue to understand the problem faced by the end user. If unable to replicate discuss with IE and check the problem.
7. Understand clearly if the issue is in frontend/backend/database(DB)
8. Root cause analysis has to be done for every issue. (Refer the SOP for Root Cause Fixture)

9. Based on the issue proceed as below:

a. For DB issues

i. Minor Changes

If the change is minor, developer/TL can directly change the SP after reviewing all dependencies with the help of RTM. Changes should be strictly reviewed by TL/DB Vertical, and then it should be executed on the live environment.

ii. Major Changes

For major changes, try to resolve the issue using supporting database scripts where possible. Check all dependencies with the help of RTM, get the scripts reviewed by TL and then execute it on live. Also, raise a Production Issue Fixture ticket and follow the standard SOP for production issue fixtures.

b. For frontend/backend issues

i. Check for Alternative Fix

If the issue can be temporarily resolved through a database-level change instead of modifying the code, follow the above mentioned database fix procedure. Raise Production Issue Fixture ticket and follow the Production Issue Fixture SOP.

ii. If Database Fix Is Not Possible

Make the required code changes. Based on the complexity of the fix, discuss testing needs with the Solution Architect. Once reviewed by TL, move the changes to production following the Deployment SOP.

10. Once issue is patched, mark back ticket to concern IE.

11. IE can close the production issue ticket after confirmation from client.

12. Ensure that all code and database changes are reviewed by the respective TL/Database vertical, as per the established review procedures.

13. Add the reference of ticket in comments/revision history of the deployment ticket.

Note: For every production issue raised, there has to be "Production issue root cause fixture" ticket raised and linked.

STANDARD OPERATING PROCEDURE

HOW TO MANAGE PRODUCTION ISSUE

Timeline to follow

Production issue to be processed in 24 hours after following due procedures

Low Priority	Medium Priority	High Priority
8 hours	4 hours	2 hours

Logging in Jira/TM

Issue Type*: Production issue

Assignee*: TL/Developer

Reporter (ticket to be created by) *: PM/IE **Priority*:**High/Medium/Low

Description: Fill in the details requested as per below

1. Menu/URL:
2. User Login (if any):
3. Designation/Office (if any):
4. Record ID/Ack No/Ref no. (if any):
5. Section of the page where issue is noticed:
6. Attached screenshot? Yes/no :
7. Any other info:

Work Logging by*:TL/Developer

Note: A production issue ticket should be **closed by the IE** only after **explicit confirmation from the client/or by verifying the same by replicating the issue** indicating that the issue has been resolved to their satisfaction.
